PAPER # \_\_\_\_1

Page 14.

Having described my invention I claim;

- 1 Fluorescent light fixture comprising;
- a a plurality of elongated light reflectors and each end of said reflectors attached to socket mount/wire arms and
- b said socket mount/wire raceway arms attached to ends of ballast channel assembly,
- c a single ballast mounted in said ballast channel assembly,
- d fluorescent light tube sockets for a plurality of fluorescent light tubes mounted on said socket mount/wire raceway arms at each end of said elongated light reflectors in the concave side of said elongated light reflectors
- e a plurality of elongated fluorescent light tubes inserted into said light tube sockets in the concave side of said elongated light reflectors and,
- f rim edges on said elongated light reflectors overlap on adjacent rim edges of said elongated light reflectors.

- 2 Fluorescent light fixture of claim 1, further consisting of;
  - a a plurality of elongated light reflectors and each end of said reflectors attached to socket mount/wire arms and,
  - b two of said socket mount/wire raceway arms attached one on each end perpendicular to ends of ballast channel assembly,
  - c a single ballast mounted in said ballast channel assembly
  - d light tube sockets for plurality of fluorescent light tubes mounted on said socket mount/wire raceway arms at each end of said plurality of elongated light reflectors in the concave side of said plurality of elongated light reflectors and
  - e said plurality of elongated light tubes inserted into said light tube sockets in the concave side of said light reflectors and,
  - f slots in said reflectors for indirect lighting and
  - g suspending, by hanger wire/chain, said assembly of fluorescent light fixture from a ceiling.

- 3 A fluorescent elongated tube light fixture, of claim 1, wherein further improvement consists of;
  - a a reflector fitting over said fluorescent elongated tube light for maximum light reflection downward
  - b said fluorescent elongated tube light having a diameter D, then the radius R of the bend of the cross section of said reflector is D X 0.875,
  - c the arc at the bend of the reflector is equal to  $120^{\circ}$ ,
  - d the sides of said reflectors are tangent to the radius at the ends of said arc,
  - e said reflector sides extend outward to a dimension between said reflector sides equal to 3.25 X diameter of the said fluorescent tube and,
  - f the distance between said fluorescent elongated tube light and the arc of the bend of said light reflector is equal to 0.375 X diameter of said fluorescent elongated tube light and,
  - g distance from bottom of said fluorescent tube light to span line between said reflector side edges is equal to 0.5 X diameter of fluorescent tube light.

4 - A method of focusing downlight of a fluorescent hanging light fixture consisting of;

- a reflectors over each fluorescent elongated light tube,
- b said reflector extending the length of said fluorescent elongated light tube,
- c cross section of said reflector comprising an arc straddling said fluorescent elongated light tube and at a space of 0.375 times diameter of said fluorescent elongated light tube from said fluorescent elongated light tube
- d said arc of said reflector having a radius of 0.875 times the diameter of said fluorescent light tube and said arc ranging from 1200 to 1600 and
- e sides of said reflector tangent at each end of said arc range of said reflector.
- f a single ballast mounted in ballast channel assembly and,
- q a plurality of said reflectors and fluorescent elongated light tubes mounted in said fluorescent elongated light fixture.
